Implementation of a feature in Macs OS X that allows users to easily share files with a list of recipients that are specified by their full e-mail address. Built-in e-mail clients such as Mail.app, iMessage and the Address Book app are also able to send and receive lists of recipients with the same ease. If an e-mail client (including Mac Mail) does not recognize a file as a "list" or "address book", it may need to be converted to the.mbox format in order to be read by Mac OS X and compatible applications. This can be done using applications such as Microsoft Outlook or Gmail. The software is currently being used by hundreds of thousands of mac users. PROS: 1. It saves a LOT of time and frustration. I spent a day or so on this file transfer program and have never been so happy to have spent a day or so on a file transfer program, and yes, I am very happy about it. 2. It is FREE. 3. It does exactly what it should. 4. It works, so far, for all my needs. CONS: 1. It doesn't do what it should to be working. As I type this review, I am still waiting for the system to send the file to the recipient. I keep trying to send it, but nothing happens. 2. It doesn't work with many file formats, including PDF. The result is that any PDF file I want to send to someone is not being read or saved by this program. This is definitely one of the better FOSS programs that I have used, and has a huge following. It works, and it is very easy to use. There are plenty of drag-and-drop features for creating and creating a list of recipients and sending the files. It has options for changing colors, editing text, specifying the font size, paragraph spacing, and line spacing. There are also options for creating different kinds of documents, such as wallpapers and cover images, and for creating a presentation deck for PowerPoint. The Kupopup system is built on the framework of Fosstit-T, a single-threaded, embeddable version of the popular Fosstit system. The Fosstit system also has been extended to support keyboard shortcut support, and is being developed as a framework that is easy to extend. Kupopup supports desktop sharing, and it can 77a5ca646e
